                                                                                                                                                                                                                                                                                                                  This DNA sequence comprises Mycobacterium bovis BCG deletion sequence BCGdelta3. A specific genetic deletion of this region casults in an avirolence phenotype of the mycobacterium. 2 Other deletion regions (see AAT33535 and AAT33536) have also been detected. Identification involved Screening a BCG cosmid library with a radiolabeled probe obtained following DNA subtraction between virulent Mycobacterium tuberculosis H37Rv and avirulent BCG. The deletions provide useful markers for the identification of an avirulent, or a virulent, mycobacterial phenotype. Determination of a virulent, or a virulent, mycobacterial phenotype. Determination of a virulence requires the detection of the presence or absence of presence or absence of absence of absence of absence of the sequences contained within the deletion. Deletion junctions (see AAT33538-46), or by detecting the presence or absence of the sequences contained within the deletion. Deletion polypeptides are used as components of immunological assays and in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

AAE53015 to AAE54536, AAE54577 to AAE54615, and AAY74253 to AAY75941 represent nevel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAE54571 to AAE54576 and AAE54616 to AAE5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for trealing or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antiagonists, which may themselves have use as antibodieterial agent S. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neisseria meningitidis; Neisseria gonorrhoeae; antigen; vaccine;

represent novel Neisseria meninglis and N. gonorrheae polynucleoides and polypeptides. AAX54537 to AAX54576 and AAZ54616 to AAZ55473 represent polypeptides. AAX54537 to AAX54576 and AAZ54616 to AAZ55473 represent polypeptides, unbedieved to the present invention. The polypeptides, the polynucleoides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing infection due to be isserial bacteria (e.g. meningits and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antiagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   AA253015 to AA254546, AA254577 to AA254615, and AAY4253 to AAY75941

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleotide sequences AA211972-212358 represent open reading frames (ORFs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see AAY38499-Y38944). The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The lgt locus (AAT14061) of Neiserria gonorrhoeae F62 contains 5 open reading frames, 1gth, 1gtb, 1gtC, 1gtD and 1gtE, coding for 5 glycosyltransferases (see also AAR9131-15) involved in gonococcal lipooligosaccharide (LOS) biosynthesis. The sequence was constructed from 2 clones isolated from an F62 gene bank in lambda-200 following screening with plasmid pR10p1. 3 of the coding sequences contain poly-G tracts that make them susceptible to premature termination. The lgt coding sequences can be used for prodn. of recombinant LGT glycosyltransferases that are utilised in biosynthesis of LOS useful in vaccine prepn.

A lippoligosaccharide-encoding gene region (AAT49230) of Neisseria gonorrhoeae ATCC 33084 includes a coding sequence for a novel Neptylytycosyltransferase (PGTase) (AAM065576) that catalyses the addition of both GirNac and GalNac disaccharides to a single galactose molety. The products (AAW06577-80) of the other coding sequences of this region are not identified. The PGTase gene can be obtd. using standard techniques and incorporated into a vector to allow produ. of the PGTase in transformed host cells. The enzyme is useful in the synthesis of oligosaccharides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                     metazoan invertebrate organisms, such as insects and worms, or cultured corls, resulting in p53 expression or mis-expression. The cultured cells, resulting in p53 expression or mis-expression. The tumour su pressor genes, a p53 polypeptide or genetically modified organisms or cells are used in screening assays to identify compounds or molecules, preferably a pharmaceutical agent or a pesticide, that modilates p53 activity. The genetically modified organisms or cells are also useful for studying p53 activity by detecting the phenotype caused by the expression or mis-expression of the p53 protein in the insect. The method additionally comprises observing a second insect having the same genetic modilication as the previous one, which causes the expression or mis-expression of the p53 protein, where the second animal additionally comprises a mutation in a desired gene and differences between the-pfenotype of the first and second identifies the desired gene as capable of modilying the function of the gene encoding the p53 protein. The genetically modified organisms or cells are also useful for identifying other genes modulating the

```
The sequence is that of a DNA fragment encoding a non-A non-B (NANB) hepatitis-specific antigen polypeptide, it can be used to produce the polypeptide recombinantly. It is derived from the DNA clone C10-F15. It can be used to dive PCP primers which are capable of detecting NANB hepatitis with high accuracy. See also AAQ20617-Q20629 and
                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Non-A, non-B hepatitis-specific antigen polypeptide - for detection of hepatitis virus gene or antibody directed against virus

The present sequence encodes the Streptococcus pneumoniae filty-four homologue (ffh) protein, which is a component of the protein secretory apparatus in bacteria, and the bacterial homologue of the eukaryotic Signal Recognition Particle. Fith proteins and polynucleotides are useful for diagnosing diseases related to over or underexpression of Ffh protein by identifying mutations in the Ffh gene, or determining Ffh protein or mRNN expression levels due to an infection of an organism with the Ffh gene. They can diagnose the stage and type of infection. Ffh proteins are also useful for screening for compounds which affect activity of the protein by measuring the binding to ffh protein and observing the stimulation or inhibition of the protein function. These can be used in treatment to inhibit (antagonist i.e. antibacterial drugs) or enhance (agonist) Ffh activity, in addition to direct administration of Ffh
                                     The sequence is that of a DNA fragment encoding a non-A non-B (NANB) hepatitis-specific antigen polypeptide, it can be used to produce the polypeptide recombinantly. It is derived from the DNA clone C10-E12. It can be used to give PCR primers which are capable of detecting NANB hepatitis with high accuracy. See also AAQ20617-Q20629 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Streptococcus pneumoniae Fifty-Four Homologue (Ffh) polypeptide and polynuclectide - useful as diagnostic reagents and for prevention and treatment of Streptococci infections, which cause otitis media, sinusitis and conjunctivitis

direct administration of antisense sequences to prevent expression. Ffh proteins (administration of antisense sequences to prevent expression. Ffh proteins (administered directly, in a vector and as a vaccine) and antibodies induce an immune response to immunise and prevent disease. Diseases diagnosed, prevented or treated include: bacterial infections, especially Streptococcus pneumoniae infections, which cause otitis media, conjunctivitis, bacteraemia, sinustias, pleural empyema, endocarditis and especially meningitis. Ffh proteins, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

(URL, http://www.%anger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in Tapparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon gaty, gty, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Deciphering the biology of Mycobacterium tuberculosis from the

/note--Rv1568, (MTCY336.35c), bioA, len: 437. Function: probable adenosylmethionine-8-amino-7-oxononanoate aminotransferase (ECZ.6.1.62) 006622. Contains aminotransferase class-III pyridoxal-phosphate attachment site (PS00600). FASTAresults, BIOA_MYCLE P4548 (436 aa) opt: 2534; E(): 0; 85.1%identityin 436 aa overlap. Also similar to other M. tuberculosis proteins e.g. MTCY27.12c, (449 aa). FASTA score: E():3.5e-16; 29.5% identity in 421 aa overlap. TBparse scoreis0.874"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /transl_table-11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Details of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.

(UML, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position of c. C. CAUTION: In some cases we may not have predicted the correct infitation codon. Where possible we choose an initiation codon (atq. gtg, or ttg) which is preceded by an upstream ribusome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Direct Submission

(URL, http://www.sanger.ac.uk/Projects/M.tuberculosis/) CDS have (URL, http://www.sanger.ac.uk/Projects/M.tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old peen renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markow Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G i C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where pussible we choose an initiation codon initiation which is preceded by an upstream ribusome binding site sequence (optimally 5-1 Mp before the initiation codon). If this cannot be identified we choose the invast upstream
                                                                                               /note="RV3448, (MTCY77.20), len: 467 aa. Unknown membrane protein, contains PS00402 Binding-protein-dependent transport systems inner membrane comp signature. Some similarity to AL021930[MTV035_18 Mycobacterium tuberculosis (472 aa) fasta score, opt: 429 z-score: 4884 E(): 1.1e-19; 28.2%identity in 479 aa overlap" /rransl_table=11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submission

probable precursor of serine protesse. Has putdive signal peptideat N-terminus and hydrophobic stretch at peptideat N-terminus three signatures typical of subtilase family: aspartic acid active site (PS00136), histidine active site (PS00137), serine active site (PS00138). FASTA results: 903863 SERINEPROTEASE (390 aa) opt: 241: E(): 8c-07; (38.0% identity in 387 aa overlap), similar to MTCX15F10.29 (45.7% identity in 451 aa overlap)"
